

mediante el método del potencial modelo. Nuestros resultados son consistentes con las observaciones astrofísicas de la emisión de 5592 Å de OIII en nebulosas planetarias y se comparan también con resultados de Dalgarno, Heil y Butler (1981, *Astrophys. J.* 245, 793) obtenidos con técnicas usuales de química cuántica.

ABSTRACT. Calculations are presented of reaction rates for the charge transfer reaction between OIV ions and atomic hydrogen that populate the 1P , 2D , 3P , 3S states of the (2p3p) configuration and the 1P_0 , 3P_0 states of the (2p3s) configuration of OIII. The temperatures considered range between 1000 and 50000 °K. By approximating the system by a quasimolecule, the theoretical study of the collision was made with the method of Grice and Herschbach (1974, *Mol. Phys.* 27, 159) where the orbitals were generated by the model potential method. Our results are consistent with the astrophysical observations of the 5592 Å emission line of OIII in planetary nebulae and are also compared with the computed values of Dalgarno, Heil and Butler (1981, *Astrophys. J.* 245, 793) obtained with the usual techniques of quantum chemistry.

ALGUNAS CONSIDERACIONES FÍSICAS SOBRE NGC 1313

SOME PHYSICAL CONSIDERATIONS ABOUT NGC 1313

E.L. Aguero

OAC - CONICET

RESUMEN. El gas ionizado en NGC 1313 fue estudiado por medios espectrofotométricos. Se analiza el comportamiento radial de las relaciones I(H α)/I(6584), I(6717)/I(6731), N(NII)/N(HII) y N(NII)/N(SII) y de las densidades electrónicas obtenidas. Las relaciones de abundancias N(N)/N(H) y N(N)/N(S) para el núcleo y dos regiones de emisión también son obtenidas y comparadas con datos previos.

ABSTRACT. The ionized gas in NGC 1313 was studied by spectrophotometric means. The radial behaviour of the I(H α)/I(6584), I(6717)/I(6731), N(NII)/N(HII) and N(NII)/N(SII) ratios and the deduced electron densities are discussed. The abundance ratios N(N)/N(H) and N(N)/N(S) for the nucleus and two emission regions were also derived and compared with previous data.
